Current Research

My research focuses on managing the complexity of modern programming languages and type theories. As programming languages and type theories introduce new features, it has become increasingly common to stratify the type system through *modalities*; thus preventing the uncontrolled mixing of features. The introduction of any modality, however, introduces serious challenges to the study of the behavior of a system. I am interested in applying modern algebraic and geometric techniques to the study of such modal type theories and programming languages.

Research visits

- **University of Paris** with Adrien Guatto December 2021

Publications

In my field, conferences are the typical venue, not journals. A conference publication is full peer-reviewed research paper and, generally, they are as or more important than journal publications. Four of the conferences below are rated at A* by **the Australian CORE rankings**. This signifies that they are in the top 4% of computer science conferences.
